QS must be parallel to PR and the rotation about it must be ϕ . This translation will move P a length equal to QQ along PR, and the rotation about QS will move P along an arc perpendicular to PR. Hence QQ must equal PN and NF must be the chord of the arc. It follows that QS must lie on a plane bisecting NP at right angles and at a distance a from PR where $NP = 2a \sin \phi$, or, which is more convenient, at a distance y from O the plane NPP where $NP = 2y \tan \phi$. The rotation θ round QS is to bring P to P' and is in the same direction as the rotation ϕ round PR. Hence the distance y must be measured from the middle point of NP in the direction in which that middle point is moved by...

Completely essential read publication. It is really basic but excitement in the fifty percent of the book. You will not really feel monotony at anytime of your respective time (that's what catalogues are for about in the event you ask me).
